NEWS RELEASE

Taper Top from Reward Offers Versatility

The new form, aiding in the design and construction of interior demising walls, is now available.

Omaha, Neb. (June 30, 2008) – The Taper Top, Reward Wall Systems’ newest insulating concrete form (ICF), features a taper on both sides of the form to provide additional concrete bearing on both faces of the wall. The form, which will satisfy the needs of both a single-sided or double-sided taper, is now available, according to Kevin Jones, vice president of Manufacturing Operations.

The Taper Top is designed for the top course of a particular story and is appropriate for both commercial and residential construction.

Available in both the 11 and 13 inch iForm[®], The Taper Top is 16 inches high and holds more concrete than the standard straight form. This allows for more concrete bearing on certain applications, such as roof trusses bearing on the top of an above grade Reward wall or floor systems such as pre-cast hollow core plank bearing on demising walls.

“The demand for building demising walls out of ICFs for the same fire protection, structural and sound resistant qualities as outside walls is continually increasing for applications such as multi-family housing, hotels and theaters,” said Darryl Ulrich, product application representative. “This Taper Top offers the design flexibility and added strength to cover such applications.”
